

Stripe

As a Product Analyst on the Billing & Subscriptions team at Stripe, you are tasked with evaluating how different pricing tiers affect customer retention and lifecycle....

Question 1: For Quarter 3 of 2024, what is the total number of distinct customers who started a subscription for each pricing tier? This query establishes baseline subscription counts for evaluating customer retention.

```
SELECT pricing_tier,  
       COUNT(DISTINCT customer_id) AS distinct_customers  
FROM fct_subscriptions  
WHERE TO_CHAR(start_date, 'YYYY-MM') IN ('2024-07', '2024-08',  
    '2024-09')  
GROUP BY pricing_tier;
```

As a Product Analyst on the Billing & Subscriptions team at Stripe, you are tasked with evaluating how different pricing tiers affect customer retention and lifecycle....

Question 2: Using subscriptions that started in Q3 2024, for each pricing tier, what percentage of subscriptions were renewed? Subscriptions that have been renewed will have a renewal status of 'Renewed'. This breakdown will help assess retention effectiveness across tiers.

```
SELECT pricing_tier,  
       SUM(CASE WHEN renewal_status = 'Renewed' THEN 1 ELSE 0  
END) * 100.0 / COUNT(*) AS renewal_percentage  
FROM fct_subscriptions  
WHERE start_date BETWEEN DATE '2024-07-01' AND DATE '2024-09-30'  
GROUP BY pricing_tier;
```

Question 3: Based on subscriptions that started in Quarter 3 of 2024, rank the pricing tiers by their retention rate. We'd like to see both the retention rate and the rank for each tier, so we can identify which pricing model keeps customers engaged the longest.

```
WITH rank AS (  
    SELECT pricing_tier,  
           SUM(CASE WHEN renewal_status = 'Renewed' THEN 1 ELSE  
0 END) * 100.0 / COUNT(*) AS renewal_percentage  
    FROM fct_subscriptions  
    WHERE start_date BETWEEN DATE '2024-07-01' AND DATE '2024-09-30'  
    GROUP BY pricing_tier  
)  
SELECT *,  
       RANK() OVER (ORDER BY renewal_percentage DESC) AS rank  
FROM rank;
```
