

Uber

As a Data Analyst on the Rides Performance team, you are investigating how to reduce driver idle time and improve trip allocation strategies....

Question 1: Based on October 2024 data, what was the average trip earnings per active hour? We want to calculate the trip earnings per hour for each driver, and then get the average across all drivers.

```
with calculate AS(  
    SELECT driver_id,  
           SUM(earnings) AS total_earning,  
           SUM(active_hour) AS total_hour,  
           SUM(earnings) / SUM(active_hour) AS avg_trip_earning_per  
_driver  
FROM(SELECT driver_id, earnings,  
           EXTRACT(EPOCH FROM trip_end_time - trip_start_time) / 3  
600.0 AS active_hour  
FROM fct_trips  
WHERE TO_CHAR(trip_start_time, 'YYYY-MM') = '2024-10') AS t  
otal  
GROUP BY driver_id)  
  
SELECT AVG(avg_trip_earning_per_driver) FROM calculate
```

As a Data Analyst on the Rides Performance team, you are investigating how to reduce driver idle time and improve trip allocation strategies....

Question 2: For each driver, identify the next trip following a trip and calculate the idle time between the previous trip's end and that next trip's start. Look only at trips that started in October 2024. This analysis will pinpoint specific downtime intervals that could be reduced to enhance ride allocation.

```
with total AS(
  SELECT trip_id,driver_id,
         trip_start_time,
         trip_end_time,
         LEAD(trip_start_time) OVER(PARTITION BY driver_id ORDER
R BY trip_start_time) AS next_start
  FROM fct_trips
 WHERE TO_CHAR(trip_start_time,'YYYY-MM') = '2024-10'
 ORDER BY trip_id, driver_id)

SELECT trip_id,
       driver_id,
       trip_end_time,
       next_start,
       CASE WHEN next_start IS NULL THEN NULL
            ELSE ROUND(EXTRACT(EPOCH FROM next_start - trip_end_time) / 3600.0,2) END AS Idle_Time
FROM total
```

Question 3: For October 2024, identify the top 2 drivers with the shortest average idle time between consecutive trips. We aim to reach out to these drivers to understand their strategies for minimizing idle time.

```
with total AS(
    SELECT trip_id,driver_id,
           trip_start_time,
           trip_end_time,
           LEAD(trip_start_time) OVER(PARTITION BY driver_id ORDER
R BY trip_start_time) AS next_start
    FROM fct_trips
    WHERE TO_CHAR(trip_start_time,'YYYY-MM') = '2024-10'
    ORDER BY trip_id, driver_id),

idle AS(
    SELECT trip_id,
           driver_id,
           trip_end_time,
           next_start,
           CASE WHEN next_start IS NULL THEN NULL
                ELSE ROUND(EXTRACT(EPOCH FROM next_start - trip_
end_time) / 3600.0,2) END AS Idle_Time
    FROM total)

SELECT driver_id, AVG(idle_time) AS avg_idle
FROM idle
GROUP BY driver_id
ORDER BY 2
LIMIT 2
```
